

Saving energy is important. In the summer the air conditioning often goes out when too many people turn it on at once. That is a very bad scenario for hospitals. However, a kind company is helping my school solve that problem. That company is the famous Nipsco.

Nipsco was kind enough to donate sixteen trees. You might be wondering how sixteen trees are going to save us energy. The trees will be placed in front of windows and other places around the school that get a lot of sunlight and heat in the summer. When the sunlight comes in through a window it heats up the room. With shade there will be less heat and the air conditioners won't have to use as much energy keeping the school cool. That will allow hospitals to use more energy.

I just really want to thank Nipsco for all of their help in making this happen. Without them we would just be wasting more energy in the summer. Also, the trees help make the school look nice. This helps make our school look like a safe environmentally friendly school. These gorgeous trees help us in saving energy, helping the environment, and looking good.

This is the first time anything like this has happened for our environmental science class. Nipsco dedicated these trees directly to this class. It makes us feel proud that we could be a huge part of this. Thank you so much Nipsco for making us environmentally friendly and for helping us save energy and money.
